Environmental change (Circle one):

1. Scientists move a group of okapis to a nature preserve that protects plants and animals. In the nature reserve, there are many hungry lions, many buzzing flies, and the healthiest food is from plants that grow underground.
2. A river floods forming a large lake and separates the okapi population. A group gets stuck in an area where there are no trees. There are only thorny shrubs, knee-high grass that the Okapis can eat, and bears roaming around nearby.
